Verrucae

Verrucae are warts that can be found anywhere on the foot but commonly occur on the soles of the feet. They can even be found around the edges of nails.

They are caused by the Human Papilloma Virus (HPV) and are passed from person to person by direct contact. The virus is thought to thrive in moist, damp environments such as swimming pools, changing room floors and communal shower areas. If an infected foot deposits skin cells onto the floor then it is possible to walk across the same floor and pick up the virus especially if your skin is cut or scratched.

Are verrucae serious?

They are harmless but in some circumstances they develop on a weight bearing area of the foot where they are likely to be painful. In these areas callus (hard skin) can also form over the top of the verruca, increasing the discomfort. Some strains of verrucae spread very quickly and can become unsightly.

Who gets verrucae?

They are most commonly seen in children, teenagers and young adults. Basically those who use communal changing rooms. In time, immunity may develop against the verruca virus but some people do remain more susceptible than others.

How do I know I have a verruca?

The classic appearance is cauliflower like, sometimes containing small black dots which are caused by small blood vessels

leaking blood into the verruca. They can vary in size and numbers. An early stage verruca can look like a small, discoloured blemish on the skin, and be easily mistaken for a corn. Sometimes a verruca can quickly spread into a cluster made up of many tiny verrucae.

A simple diagnostic test is to pinch the skin (like you would squeeze a spot) where you think you may have a verruca. If it hurts, you may have a verruca. Corns tend not to hurt if you pinch them, but hurt if you press them. Pressing a verruca is generally painless. If you are still unsure before starting treatment, see a podiatrist or speak to your local pharmacist.

How do I treat my verruca?

Evidence has shown that, in many cases, verrucae will disappear of their own accord within 2 years and therefore if it is painless no treatment is required. Sometimes treatment can increase the risk of

cross infection, so that the verrucae spreads. The body's defence mechanism, the immune system, will recognise the virus and fight the infection. Due to the nature of the virus, this may take many months to happen. Letting nature heal the verruca is the best and safest course of action. For painful, unsightly verrucae, or ones which are spreading, you may choose to self treat or seek professional help from a podiatrist.

Should you self treat, evidence has shown that ointments and gels containing salicylic acid are the most effective. Sometimes just by rubbing away the dry skin over the verruca and applying a plaster can stimulate the body's immune system to fight the infection. Never self treat if you have diabetes, poor circulation, are pregnant or have any other conditions affecting the

health of your feet. If you have diabetes, check with a podiatrist or your pharmacist before self treating.

What happens if I decide to seek treatment?

The podiatrist will carry out an assessment of your general health as well as your foot health before deciding on a treatment plan.

Treatments may include:

Acid based treatments:

This involves ointments or liquids containing acids, which are usually stronger than over the counter preparations, being applied to the verruca. These acids act by carefully and gently destroying the very surface of the skin that the virus has infected. The podiatrist will apply the treatment to the skin at weekly intervals after removing

the overlying skin the treatment has destroyed. Immediately after treatment the affected foot needs to be kept dry for three to five days.

Cryotherapy

This involves freezing the verruca with liquid nitrogen or nitrous oxide gas. This needs to be done at approximately three weekly intervals over a few months before the verruca is fully healed.

However, it can lead to soreness and blistering in some people. You can still swim after this treatment, but it's not advised for sensitive or anxious children.

Electrosurgery and excisional surgery

Electrosurgery involves the use of a local anaesthetic and destroys the the tissue using heat. Excisional surgery uses a scalpel to remove the affected tissue.

Laser surgery

Lasers are sometimes used to kill the virus. This is useful for treating portions of large verrucae at a time.

Sometimes, even with a course of treatment, a verruca may not resolve. This could be due in part to your immune system not recognising the virus. In this situation it is advisable to withdraw treatment but to continue rubbing the verruca with a pumice stone or an emery board. Evidence has shown even the most stubborn of verrucae do heal eventually but may take more than 4 years to do so.

Can I avoid catching verrucae?

Minimise your chances of catching verrucae by keeping your feet in a healthy condition. Use creams and lotions if your skin is dry and use surgical spirit if your

feet are excessively sweaty. Treat other conditions such as Athlete's foot, which can damage the skin surface. Wear flip-flops in communal changing areas and don't share towels. Verruca socks can help avoid passing on the virus and also can be worn as a preventative measure.

Health Professions Council (HPC)

The HPC is a UK-wide regulatory body, which regulates 13 health professions. Since July 2005, only those who have satisfied the criteria for registration with the HPC can call themselves a chiropodist and podiatrist. Attending an HPC registered podiatrist helps ensure your health professional is genuine. The Society of Chiropodists and Podiatrists is the leading body for HPC registered Chiropodists and Podiatrists.

How do I contact a podiatrist

To talk to a local HPC registered podiatrist you can see either an NHS podiatrist or a private practitioner podiatrist:

NHS Podiatrist

To contact an NHS podiatrist you can either ask for a referral from your GP to your local NHS Podiatry Department or in many areas you can now self refer directly to that NHS Podiatry Department.

Private Practitioner

To find a private practitioner in your area you can use and the Society's own list of Private Practitioners at www.feetforlife.org or try www.yell.com. For hard copy directories please see the Yellow

Pages and Thomson Local and look out for the Society entries.

To ensure that the podiatrist you are visiting is registered please see www.hpc-uk.org for a full list of all registered podiatrists.

Further foot health information

The Society of Chiropodists and Podiatrists provides a number of foot health information leaflets for you to either download in PDF form from the Society's website, www.feetforlife.org.
